

PROPOSAL FOR ORA DEVELOPERS

A cinematic sales instrument.

Bayn, elevated. Every ORA project, geospatial and live.

01 · EXECUTIVE SUMMARY

Cinematic sales, over the pipeline you already run.

DP Interactive is an interactive sales instrument that shows an ORA development the way a buyer actually decides on it: in geographic context, in real dimension, and in real time. It runs alongside the sales pipeline you already operate in Salesforce, without asking your team to change systems. Bayn is the natural first project. The same platform then extends across the ORA portfolio.

This document summarises what we studied on the current Bayn sales tool, where an interactive map earns its place, how a Salesforce link turns the map into live pipeline surface, and how we would deliver it in phases with a working prototype available in weeks, not quarters.

02 · WHAT WE STUDIED

Bayn sales tool · baynsalestool.ora-uae.com

We reviewed the live Bayn sales tool end-to-end. The tool is clearly the product of a thoughtful team, and there is real craft in it. Our read below is grouped honestly, so the opportunity is easy to see.

Strengths worth preserving

- Clear information architecture: masterplan, virtual tour, floor plans, gallery, video, and neighborhood as first-class sections.
- A saved-homes shortlist available across the session, and a dedicated sales-tool subdomain that suggests a rep-led usage pattern.
- One control that toggles the same view between amenities and inventory clusters, so a buyer can shift lens without leaving the plan.
- A cinematic hero on the splash, and a three-tier brand hierarchy (project · area · developer) that reads cleanly.

Where the tool leaves value on the table

- The masterplan is a static rendered illustration. It does not show where in the country the site sits, how it relates to Abu Dhabi, or what the surrounding coastline actually looks like.
- There is no true 3D of the buildings, and no camera choreography. A buyer cannot orbit, tilt, or fly through.
- There is no visible link to live inventory. Unit counts are painted on the illustration and cannot reflect a sale that closed this morning.
- The initial preload is long and blocking, which is felt on cellular connections.

- The composition is desktop-first. On a phone, the sidebar-and-canvas layout does not fit thumb-reach expectations.

03 · THE OPPORTUNITY

Three things a rendered image cannot do.

The current tool has done the informational work well. The next lift is experiential and operational, and it is what buyers reliably respond to in a live meeting.

01 Geographic truth	Zoom from a real globe into the exact site, over live satellite imagery, so the buyer sees where Ghantoot actually is on the coast and how it relates to Abu Dhabi and Dubai. This is what a rendered image cannot do.
02 Real dimension	The masterplan rendered as three.js geometry, with day and night lighting, and a top-view or perspective toggle. A rep can orbit and drop into a specific phase live, in the room, without pre-rendered fly-throughs.
03 Live pipeline	Unit availability, pricing, and status pulled from Salesforce and reflected on the map in near real time. Enquiries and viewing requests submitted from the map arrive back in Salesforce as leads and tasks, attached to the exact unit and the buyer's shortlist.

04 · WHAT DP INTERACTIVE ADDS

The demonstrable difference.

- A cinematic entry that flies from a real globe into the exact site, with the correct time-of-day imagery beneath.
- A real 3D masterplan rendered live, with camera choreography, day and night lighting, and perspective controls.
- Live satellite and aerial imagery underneath the model, from a properly licensed provider.
- Aerial photography and video woven into the flow at the hero moment, not buried in a separate tab.
- Progressive, background asset loading so the buyer is never held at a blocking spinner.
- A mobile-first composition that keeps the pitch usable on a phone in the room during a viewing.
- A permanent shortlist and a shareable rep-linked customer session, so a conversation can resume next visit without re-explanation.

05 · SALESFORCE INTEGRATION

The pipeline you already run. Made visible.

Because ORA already operates on Salesforce, DP Interactive is the customer-facing surface over your existing pipeline, not a replacement for any of it. The rep continues to work in Salesforce. The buyer sees the map. Both are always in sync.

What the map reads from Salesforce

- Unit inventory · count, phase, availability, pricing, status (available, reserved, sold).
- A specific buyer's saved shortlist, so their homes come back the moment they open the map again.
- Sales rep assignment and territory, so the right person is notified on enquiry.

What the map writes back to Salesforce

- Enquiries and viewing requests submitted from the map, created as leads or tasks against the exact unit.
- Session activity · which clusters were explored, how long, which units the buyer starred.
- Shortlist changes made in the map, synced to the buyer's contact record.

Delivery approach

- All credentials and API calls handled server-side. Nothing sensitive leaves the ORA controlled boundary.
- OAuth 2.0 through a Salesforce Connected App, provisioned by ORA IT with least-privilege field access.
- A thin adapter layer mapping ORA's custom Salesforce objects to the DP schema, so any future schema changes are absorbed in one place.
- Short-TTL caching and Platform Event webhooks, so unit status is fresh without straining API limits.

The commercial story is clear. ORA does not migrate anything. DP Interactive raises the visible standard of the sales experience, and turns every buyer session into structured pipeline activity that a Salesforce user can act on the same day.

06 · PROPOSED INFORMATION ARCHITECTURE

One project space. Six layered lenses. One live shortlist.

The proposed layout keeps the cinematic entry that carries the first impression, then settles into a project space with a persistent sidebar rail. Six sibling views drill from the site as a whole into a single unit, in the order a buyer actually explores.

Section	Purpose
01 Masterplan	Live 3D of the site. Amenity or availability lens, toggled at the base of the frame.

02 Neighborhood	Real map layer of the surrounding area. Schools, hospitals, retail, beaches, drive times.
03 Gallery	Curated aerial and on-ground photography for the site.
04 Video	The aerial fly-through and construction-progress footage.
05 Floor plans	Unit-level drill-down. Live availability. Star to add to shortlist.
06 Virtual tour	Immersive interior walkthrough where the assets exist. Coming-soon panel otherwise.

Elements that persist across every section

- A three-tier breadcrumb · ORA · Ghantoot · Bayn.
- A shortlist chip with count, that opens a right-side drawer of saved units and syncs to the buyer's Salesforce contact.
- A project switcher, so a rep can pivot between ORA developments in a single session.
- A small orientation panel when zoomed into the masterplan, so the buyer never loses their place.

07 · PHASED BUILD PLAN

Each phase ships a working product.

The plan is intentionally staged so ORA can see and use the product early, and each phase is independently valuable even if the next is delayed.

Phase 1 · Foundation	Cinematic entry, real 3D masterplan for Bayn, sidebar rail, all six sections scaffolded, amenity or availability toggle wired to hard-coded cluster data. First deliverable ORA can share and open in a browser.
Phase 2 · Live pipeline	Salesforce read integration. The availability lens now shows real unit counts, statuses, and pricing. Any change made in Salesforce is reflected on the map within the cache window. First moment where the map becomes a live sales surface.
Phase 3 · Drill-down	Floor plans and unit cards, shortlist syncing to Salesforce contact, enquiry and viewing-request writes back to Salesforce as leads and tasks against the specific unit.
Phase 4 · Surrounding	The Neighborhood section, with a real map layer for schools, hospitals, retail, beaches, and drive-time isochrones from the site.
Phase 5 · Immersive	Virtual tour integration, custom camera experiences for hero moments, and rep-shareable customer session URLs that resume with the buyer's history.

08 · NEXT STEPS

A short path to a working demonstration.

- A ninety-minute discovery workshop with ORA sales and IT, covering the Salesforce schema and a target unit for the read integration.
 - A working prototype seeded with Bayn as the flagship, deployed to a private URL for ORA review.
 - A live in-room demonstration for ORA leadership, followed by a proposed commercial framing for the full engagement.
-

Prepared by DP Productions. For questions or to schedule the discovery workshop, please respond to this document.
